

Scientific Symposium

Update your biosafety testing of biologics

Dr. Reginald Clayton

Abstract

Biosafety testing has historically centered around a collection of classical in-vitro and in-vivo assays that address the risks of contamination present in raw materials, and in the manufacturing process. Historically, the requirements for in-vivo testing of cell banks and for long duration in vitro assays has impacted release times for raw materials and products, and the regulatory background has been rigid and prescriptive regarding the analytics to address the risks for adventitious viruses and extraneous agents.
